

Medium current 1.2 to 37 V adjustable voltage regulator

Features

- Output voltage range: 1.2 to 37 V
- Output current in excess of 500 mA
- Line regulation typ. 0.01 %
- Load regulation typ. 0.1 %
- Thermal overload protection
- Short circuit protection
- Output transition safe area compensation
- Floating operation for high voltage applications

Description

The LM217M/LM317M are monolithic integrated circuits in TO-220 and DPAK packages intended for use as positive adjustable voltage regulators. They are designed to supply until 500 mA of load current with an output voltage adjustable over a 1.2 to 37 V range.

The nominal output voltage is selected by means of only a resistive divider, making the device

exceptionally easy to use and eliminating the stocking of many fixed regulators.

6 Application information

The LM217M/LM317M provide an internal reference voltage of 1.25 V between the output and adjustment terminals. These devices are used to set a constant current flow across an external resistor divider (see [Figure 6](#)), giving an output voltage V_O of: $V_O = V_{REF} (1 + R_2 / R_1) + I_{ADJ} R_2$.

The devices were designed to minimize the term I_{ADJ} (100 μ A max) and to maintain it very constant in line and load changes. Usually, the error term $I_{ADJ} \times R_2$ can be neglected. To obtain the previous requirement, all the regulator quiescent current is returned to the output terminal, imposing a minimum load current condition. If the load is insufficient, the output voltage will rise.

Since the LM217M/LM317M devices are floating regulators and "see" only the input-to-output differential voltage, supplies of very high voltage with respect to ground can be regulated as long as the maximum input-to-output differential is not exceeded. Furthermore, programmable regulators are easily obtained and, by connecting a fixed resistor between the adjustment and output, the devices can be used as a precision current regulator. In order to optimize the load regulation, the current set resistor R_1 (see [Figure 6](#)) should be tied as close as possible to the regulator, while the ground terminal of R_2 should be near the ground of the load to provide remote ground sensing.

6.1 External capacitors ([Figure 8](#))

Normally no capacitors are needed unless the devices are situated far from the input filter capacitors; in which case an input bypass is needed.

A 0.1 μ F disc or 1 μ F tantalum input bypass capacitor (C_1) is recommended to reduce the sensitivity to input line impedance.

The adjustment terminal may be bypassed to ground to improve ripple rejection. This capacitor (C_{ADJ}) prevents ripple from being amplified as the output voltage is increased. A 10 μ F capacitor should improve ripple rejection of about 80 dB at 120 Hz in a 10 V application.

Although the LM217M/LM317M devices are stable with no output capacitance like any feedback circuit, certain values of external capacitance can cause excessive ringing. An output capacitance (C_O) in the form of a 1 μ F tantalum or 25 μ F aluminium electrolytic capacitor on the output swamps this effect and insures stability.

6.2 Protection diodes ([Figure 8](#))

When external capacitors are used with any IC regulator it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator.

[Figure 6](#) shows the LM217M/LM317M with the recommended protection diodes for output voltages in excess of 25 V or high capacitance values ($C_3 > 25 \mu$ F, $C_2 > 10 \mu$ F). Diode D1 prevents C_3 from discharging through the IC during an input short-circuit. The combination of diodes D1 and D2 prevents C_2 from discharging through the regulator during an input or output short-circuit.

6.3 Start-up block

It's not guaranteed the Re-Boot of the device when the junction temperature is over 85 °C.

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
