

TPS6040x-Q1 Unregulated 60-mA Charge Pump Voltage Inverter

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Test Guidance With the Following Results:
 - Device Temperature Grade 1: -40°C to $+125^{\circ}\text{C}$ Ambient Operating Temperature Range
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C6
- Inverts Input Supply Voltage
- Up to 60-mA Output Current
- Only Three Small 1- μF Ceramic Capacitors Needed
- Input Voltage Range From 1.8 V to 5.25 V
- PowerSave-Mode for Improved Efficiency at Low Output Currents (TPS60400-Q1)
- Device Quiescent Current Typical: 100 μA
- Integrated Active Schottky-Diode for Start-Up Into Load
- Small 5-Pin SOT23 Package
- Evaluation Module Available: TPS60400EVM-178

2 Applications

- Automotive Infotainment
- Automotive Cluster
- LCD Displays
- Negative Supply Voltages

Typical Application Circuit

3 Description

The TPS6040x-Q1 family of devices generate an unregulated negative output voltage from an input voltage ranging from 1.8 V to 5.25 V. The devices are typically supplied by a preregulated supply rail of 5 V or 3.3 V. Due to its wide-input voltage range, two or three NiCd, NiMH, or alkaline battery cells, as well as one Li-Ion cell, can also power them.

Only three external 1- μF capacitors are required to build a complete DC-DC charge pump inverter. Assembled in a 5-pin SOT-23 package, the complete converter can be built on a 50-mm² board area. Replacing the Schottky diode typically needed for start-up into load with integrated circuitry can achieve additional board area and component count reduction.

The TPS6040x-Q1 can deliver a maximum output current of 60 mA, with a typical conversion efficiency of greater than 90% over a wide output current range. Three device options TPS60401/2/3-Q1 with 20-kHz, 50-kHz, and 250-kHz fixed frequency operation are available. TPS60400-Q1 device comes with a variable switching frequency to reduce operating current in applications with a wide load range and enables the design with low-value capacitors.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS6040x-Q1	SOT-23 (5)	2.80 mm x 2.90 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

Changes from Revision A (June 2008) to Revision B	Page
• Added <i>Device Information</i> table, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section.....	1
• Changed TPS6040x to TPS6040x-Q1 throughout document	1
• Added AEC-Q100 Test Guidance bullets.....	1
• Changed Input voltage range throughout document to 1.8 V to 5.25 V.....	1
• Changed input voltage 5.5 V to 5.25 V.	1
• Added device options TPS60401/2/3-Q1	1
• Deleted <i>Available Options</i> table and moved <i>device family products</i> section and renamed to <i>Device Comparison Table</i>	3
• Changed reference to <i>Thermal Information</i>	3
• Deleted Machine model (MM) from ESD Ratings table.....	4
• Added table note to reference values	4
• Deleted <i>Dissipation Ratings</i> section and replaced with <i>Thermal Information</i> table	5
• Changed Figure 1 and Figure 2 Output Current limit to 60 mA	6
• Split equation (1) into two separate numbered equations	11
• Moved equation definitions to corresponding equation	11
• Deleted <i>Voltage Inverter</i> title	13
• Deleted Table 4 and Table 5 manufacturer part information	13
• Moved Figure 21 and 22 to <i>Application Curves</i> section.....	15

5 Device Comparison Table

PART NUMBER	TYPICAL FLYING CAPACITOR (μF)	FEATURE
TPS60400-Q1	1	Variable switching frequency 50 kHz to 250 kHz
TPS60401-Q1	10	Fixed frequency 20 kHz
TPS60402-Q1	3.3	Fixed frequency 50 kHz
TPS60403-Q1	1	Fixed frequency 250 kHz

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
$C_{\text{FLY}+}$	5	I	Positive terminal of the flying capacitor $C_{(\text{fly})}$
$C_{\text{FLY}-}$	3	I	Negative terminal of the flying capacitor $C_{(\text{fly})}$
GND	4	GND	Ground
IN	2	PWR	Supply input. Connect to an input supply in the 1.8-V to 5.25-V range. Bypass IN to GND with a capacitor that has the same value as the flying capacitor.
OUT	1	O	Power output with $V_{\text{O}} = -V_{\text{I}}$. Bypass OUT to GND with the output filter capacitor C_{O} .

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage range	IN to GND	-0.3	5.5	V
	OUT to GND	-5	0.3	
	$C_{\text{FLY}-}$ to GND	0.3	$V_{\text{O}} - 0.3$	
	$C_{\text{FLY}+}$ to GND	-0.3	$V_{\text{I}} + 0.3$	
Continuous power dissipation		See Thermal Information		
Continuous output current		80		mA
Maximum junction temperature, T_{J}		150		$^{\circ}\text{C}$
Storage temperature, T_{stg}		-55		$^{\circ}\text{C}$

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000
		Charged-device model (CDM), per AEC Q100-011	±1000

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_I	Input voltage	1.8		5.25	V
I_O	Output current at OUT			60	mA
C_I	Input capacitor	0	$C_{(fly)}$ ⁽¹⁾		μF
$C_{(fly)}$	Flying capacitor		1		μF
C_O	Output capacitor		1	100	μF
T_J	Operating junction temperature	–40		125	°C

(1) Refer to [Device Comparison Table](#) for C_{fly} values

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS6040x-Q1	UNIT
		DBV (SOT-25)	
		5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	221.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	81.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	39.8	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	3.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	38.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#).

7.5 Electrical Characteristics

$C_I = C_{(fly)} = C_O$ (according to [Table 2](#)), $T_J = -40^\circ\text{C}$ to 125°C , and $V_I = 5\text{ V}$ over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_I	Supply voltage range	At $T_J = -40^\circ\text{C}$ to 125°C , $R_L = 5\text{ k}\Omega$	1.8		5.25	V
		At $T_C \geq 0^\circ\text{C}$, $R_L = 5\text{ k}\Omega$	1.6			
I_O	Maximum output current at V_O		60			mA
V_O	Output voltage			$-V_I$		V
V_{P-P}	Output voltage ripple	$I_O = 5\text{ mA}$	TPS60400-Q1, $C_{(fly)} = 1\text{ }\mu\text{F}$, $C_O = 2.2\text{ }\mu\text{F}$	35		mV _{P-P}
			TPS60401-Q1, $C_{(fly)} = C_O = 10\text{ }\mu\text{F}$	20		
			TPS60402-Q1, $C_{(fly)} = C_O = 3.3\text{ }\mu\text{F}$	20		
			TPS60403-Q1, $C_{(fly)} = C_O = 1\text{ }\mu\text{F}$	15		

Electrical Characteristics (continued)

$C_1 = C_{(fly)} = C_O$ (according to Table 2), $T_J = -40^\circ\text{C}$ to 125°C , and $V_I = 5\text{ V}$ over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
I_Q	Quiescent current (no-load input current)	$V_I = 5\text{ V}$	TPS60400-Q1	125	270	μA

8 Detailed Description

8.1 Overview

The TPS6040x-Q1 charge pumps invert the voltage applied to their input. For the highest performance, use low equivalent series resistance (ESR) capacitors (for example, ceramic). During the first half-cycle, switches S2 and S4 open, switches S1 and S3 close, and capacitor ($C_{(fly)}$) charges to the voltage at V_I . During the second half-cycle, S1 and S3 open, and S2 and S4 close. This connects the positive terminal of $C_{(fly)}$ to GND and the negative to V_O . By connecting $C_{(fly)}$ in parallel, C_O is charged negative. The actual voltage at the output is more positive than $-V_I$, since switches S1–S4 have resistance and the load drains charge from C_O .

Figure 20. Operating Principle

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Charge-Pump Output Resistance

The TPS6040x-Q1 devices are not voltage regulators. The output source resistance of the charge pumps is approximately 15 Ω at room temperature (with $V_I = 5$ V), and V_O approaches -5 V when lightly loaded. V_O will droop toward GND as load current increases as seen in [Equation 1](#).

$$V_O = -(V_I - R_O \times I_O) \quad (1)$$

$$R_O \approx \frac{1}{f_{osc} \times C_{(fly)}} + 4(2 \times R_{SWITCH} + ESR_{CFLY}) + ESR_{CO}$$

where

- R_O = output resistance of the converter
 - R_{SWITCH} = resistance of a single MOSFET-switch inside the converter
 - f_{osc} = oscillator frequency
- (2)

8.3.2 Efficiency Considerations

The power efficiency of a switched-capacitor voltage converter is affected by three factors: the internal losses in the converter IC, the resistive losses of the capacitors, and the conversion losses during charge transfer between the capacitors. The internal losses are associated with the internal functions of the ICs, such as driving the switches, oscillator, and so forth. These losses are affected by operating conditions such as input voltage, temperature, and frequency. The next two losses are associated with the voltage converter circuit's output resistance. Switch losses occur because of the on-resistance of the MOSFET switches in the IC. Charge-pump capacitor losses occur because of their ESR. The relationship between these losses and the output resistance is [Equation 3](#).

$$P_{CAPACITOR \text{ LOSSES}} + P_{CONVERSION \text{ LOSSES}} = I_O^2 \times R_O \quad (3)$$

The first term is the effective resistance from an ideal switched-capacitor circuit. Conversion losses occur during the charge transfer between $C_{(fly)}$ and C_O when there is a voltage difference between them. The power loss is [Equation 4](#).

$$P_{CONV.LOSS} = \left[\frac{1}{2} \times C_{(fly)} (V_I^2 - V_O^2) + \frac{1}{2} C_O (V_{RIPPLE}^2 - 2V_O V_{RIPPLE}) \right] \times f_{osc} \quad (4)$$

The efficiency of the TPS6040x-Q1 devices is dominated by their quiescent supply current at low output current and by their output impedance at higher current (see [Equation 5](#)).

$$\eta = \frac{I_O}{I_O + I_Q} \left(1 - \frac{I_O \times R_O}{V_I} \right)$$

where

- I_Q = quiescent current
- (5)

8.4 Device Functional Modes

8.4.1 Active-Schottky Diode

For a short period of time, when the input voltage is applied, but the inverter is not yet working, the output capacitor is charged positive by the load. To prevent the output being pulled above GND, a Schottky diode must be added in parallel to the output. The function of this diode is integrated into the TPS6040x-Q1 devices, which gives a defined startup performance and saves board space.

A current sink and a diode in series can approximate the behavior of a typical, modern operational amplifier. [Figure 21](#) shows the current into this typical load at a given voltage. The TPS6040x-Q1 devices are optimized to start into these loads.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS6040x-Q1 family of devices generate an unregulated negative output voltage from an input voltage ranging from 1.8 V to 5.25 V.

9.2 Typical Applications

The most common application for these devices is a charge-pump voltage inverter (see [Figure 23](#)). This application requires only two external components; capacitors $C_{(fly)}$ and C_O , plus a bypass capacitor, if necessary. See [Capacitor Selection](#) for suggested capacitor types.

Copyright © 2016, Texas Instruments Incorporated

Figure 23. Typical Operating Circuit

9.2.1 Design Requirements

The TPS6040x-Q1 is connected to generate a negative output voltage with 60-mA maximum load, from a positive input voltage between 1.8 V and 5.25 V.

9.2.2 Detailed Design Procedure

For the maximum output current and best performance, three ceramic capacitors of 1 μF (TPS60400-Q1, TPS60403-Q1) are recommended. For lower currents or higher allowed output voltage ripple, other capacitors can also be used. TI recommends the output capacitors has a minimum value of 1 μF . With flying capacitors lower than 1 μF , the maximum output power will decrease.

9.2.2.1 Capacitor Selection

To maintain the lowest output resistance, use capacitors with low ESR (see [Table 2](#)). The charge-pump output resistance is a function of the ESR of $C_{(fly)}$ and C_O . Therefore, minimizing the ESR of the charge-pump capacitor minimizes the total output resistance. The capacitor values are closely linked to the required output current and the output noise and ripple requirements. It is possible to only use 1- μF capacitors of the same type. Ceramic capacitors will provide the lowest output voltage ripple because they typically have the lowest ESR-rating.

Table 2. Recommended Capacitor Values

DEVICE	V _I [V]	I _O [mA]	C _I [μF]	C _(fly) [μF]	C _O [μF]
TPS60400	1.8 to 5.25	60	1	1	1
TPS60401	1.8 to 5.25	60	10	10	10
TPS60402	1.8 to 5.25	60	3.3	3.3	3.3
TPS60403	1.8 to 5.25	60	1	1	1

9.2.2.2 Input Capacitor (C_I)

Bypass the incoming supply to reduce AC impedance and the impact of the TPS6040x-Q1 switching noise. The recommended bypassing depends on the circuit configuration and where the load is connected. When the inverter is loaded from OUT to GND, current from the supply switches between $2 \times I_O$ and zero. Therefore, use a large bypass capacitor (for example, equal to the value of C_(fly)) if the supply has high AC impedance. When the inverter is loaded from IN to OUT, the circuit draws $2 \times I_O$ constantly, except for short switching spikes. A 0.1-μF bypass capacitor is sufficient.

9.2.2.3 Flying Capacitor (C_(fly))

Increasing the flying capacitor's size reduces the output resistance. Small values increases the output resistance. Above a certain point, increasing the capacitance of C_(fly) has a negligible effect, because the output resistance becomes dominated by the internal switch resistance and capacitor ESR.

9.2.2.4 Output Capacitor (C_O)

Increasing the output capacitor's size reduces the output ripple voltage. Decreasing its ESR reduces both output resistance and ripple. Smaller capacitance values can be used with light loads if higher output ripple can be tolerated. Use Equation 6 to calculate the peak-to-peak ripple.

$$V_{O(\text{ripple})} = \frac{I_O}{f_{\text{osc}} \times C_O} + 2 \times I_O \times \text{ESR}_{CO} \quad (6)$$

9.2.2.5 Power Dissipation

As given in [Thermal Information](#), the thermal resistance of the unsoldered package is R_{θJA} = 221.2°C/W. Soldered on the EVM, a typical thermal resistance of R_{θJA(EVM)} = 180°C/W was measured. The terminal resistance can be calculated using Equation 7.

$$R_{\theta JA} = \frac{T_J - T_A}{P_D}$$

where

- T_J is the junction temperature
- T_A is the ambient temperature
- P_D is the power that needs to be dissipated by the device

The maximum power dissipation can be calculated using Equation 8.

$$P_D = V_I \times I_I - V_O \times I_O = V_{I(\text{max})} \times (I_O + I_{(\text{SUPPLY})}) - V_O \times I_O \quad (8)$$

The maximum power dissipation happens with maximum input voltage and maximum output current.

At maximum load the supply current is 0.7 mA maximum (see Equation 9).

$$P_D = 5 \text{ V} \times (60 \text{ mA} + 0.7 \text{ mA}) - 4.4 \text{ V} \times 60 \text{ mA} = 40 \text{ mW} \quad (9)$$

With this maximum rating and the thermal resistance of the device on the EVM, the maximum temperature rise above ambient temperature can be calculated using Equation 10.

$$\Delta T_J = R_{\theta JA} \times P_D = 180^\circ\text{C/W} \times 40 \text{ mW} = 7.2^\circ\text{C} \quad (10)$$

This means that the internal dissipation increases T_J by < 10°C.

The junction temperature of the device shall not exceed 125°C.

This means the device can easily be used at ambient temperatures up to Equation 11.

$$T_A - T_{J(\text{max})} - \Delta T_J - 125^\circ\text{C/W} - 10^\circ\text{C} = 115^\circ\text{C} \quad (11)$$

9.2.3 Application Curves

9.3 System Examples

9.3.1 RC-Post Filter

To reduce the output voltage ripple a RC-post filter can be used (Figure 26).

Copyright © 2016, Texas Instruments Incorporated

Figure 26. TPS60400 and TPS60401 With RC-Post Filter

An output filter can easily be formed with a resistor (R_P) and a capacitor (C_P). Cutoff frequency is given by Equation 12.

$$f_c = \frac{1}{2\pi R_P C_P} \tag{12}$$

The ratio V_O/V_{OUT} is determined by Equation 13.

System Examples (continued)

$$\left| \frac{V_O}{V_{OUT}} \right| = \frac{1}{\sqrt{1 + (2\pi f R_P C_P)^2}}$$

$$\text{with } R_P = 50 \Omega, C_P = 0.1 \mu\text{F} \text{ and } f = 250 \text{ kHz} : \left| \frac{V_O}{V_{OUT}} \right| = 0.125 \quad (13)$$

The formula refers only to the relation between output and input of the ac ripple voltages of the filter.

9.3.2 LC-Post Filter

To reduce the output voltage ripple, an LC-post filter can be used.

Figure 27 shows a configuration with a LC-post filter to further reduce output ripple and noise.

Copyright © 2016, Texas Instruments Incorporated

Figure 27. LC-Post Filter

Table 3 contains the typical measurement results using the TPS60400-Q1 device.

Table 3. Measurement Results on the TPS60400-Q1 (Typical)

V_I [V]	$I_{O(2)}$ [mA]	C_1 [μF] CERAMIC	$C_{(fly)}$ [μF] CERAMIC	C_O [μF] CERAMIC	L_P [μH]	C_P [μF] CERAMIC	BW = 500 MHz $V_{P_{OUT}}$ V_{P-P} [mV]	BW = 20 MHz $V_{P_{OUT}}$ V_{P-P} [mV]	$V_{P_{OUT}}$ V_{ACeff} [mV]

9.3.3 Rail Splitter

A switched-capacitor voltage inverter can be configured as a high efficiency rail-splitter. This circuit provides a bipolar power supply that is useful in battery powered systems to supply dual-rail ICs, like operational amplifiers. Moreover, the SOT23-5 package and associated components require very little board space.

The maximum input voltage between V_I and GND in Figure 28 (or between IN and OUT at the device itself) must not exceed 6.5 V.

Copyright © 2016, Texas Instruments Incorporated

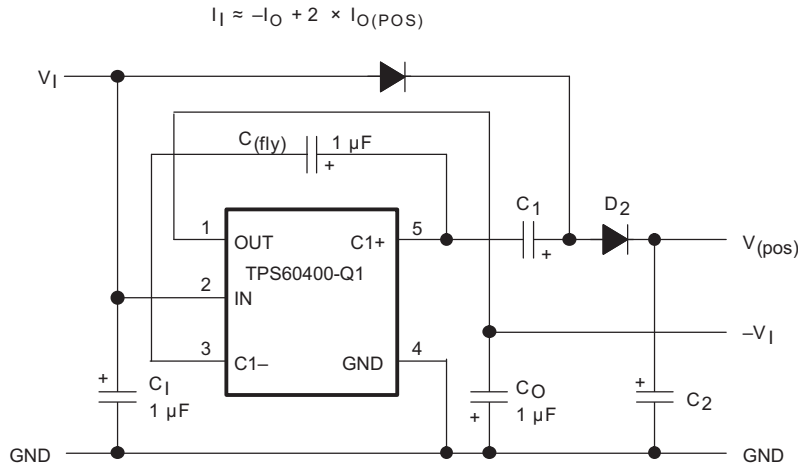

Figure 28. TPS60400 as a High-Efficiency Rail Splitter

After power is applied, the flying capacitor ($C_{(fly)}$) connects alternately across the output capacitors C_3 and C_0 . This equalizes the voltage on those capacitors and draws current from V_1 to V_O as required to maintain the output at $1/2 V_1$.

9.3.4 Combined Doubler/Inverter

The application allows to generate a voltage rail at a level of $-V_i$ as well as $2 \times V_i$ ($V_{(pos)}$).

In the circuit of Figure 29, capacitors C_1 , $C_{(fly)}$, and C_0 form the inverter, while C_1 and C_2 form the doubler. C_1 and $C_{(fly)}$ are the flying capacitors; C_0 and C_2 are the output capacitors. Because both the inverter and doubler use part of the charge-pump circuit, loading either output causes both outputs to decline toward GND. Make sure the sum of the currents drawn from the two outputs does not exceed 60 mA. The maximum output current at $V_{(pos)}$ must not exceed 30 mA. If the negative output is loaded, this current must be further reduced.

Copyright © 2016, Texas Instruments Incorporated

Figure 29. TPS60400-Q1 as Doubler/Inverter

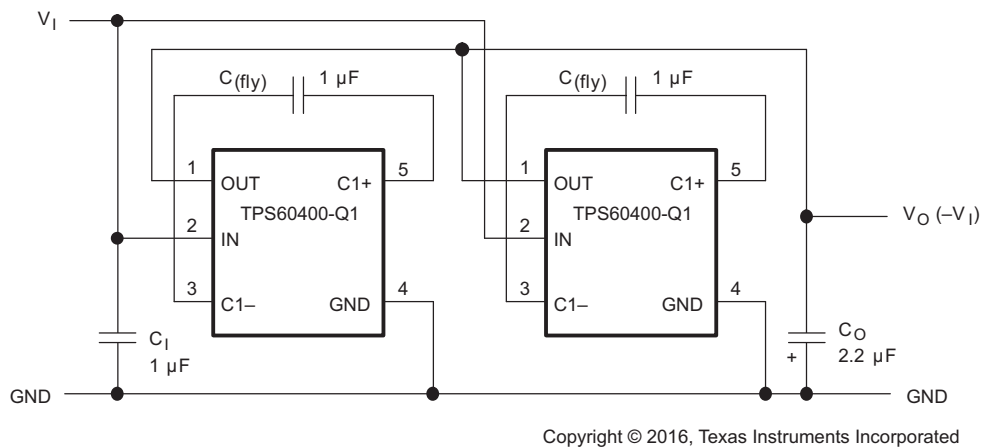

9.3.5 Cascading Devices

Two devices can be cascaded to produce an even larger negative voltage (see Figure 30). The unloaded output voltage is normally $-2 \times V_1$, but this is reduced slightly by the output resistance of the first device multiplied by the quiescent current of the second. When cascading more than two devices, the output resistance rises dramatically.

Figure 30. Doubling Inverter

9.3.6 Paralleling Devices

Paralleling multiple TPS6040x-Q1s reduces the output resistance. Each device requires its own flying capacitor ($C_{(fly)}$), but the output capacitor (C_O) serves all devices (see [Figure 31](#)). Increase C_O 's value by a factor of n , where n is the number of parallel devices. [Equation 2](#) shows the equation for calculating output resistance.

Figure 31. Paralleling Devices

9.3.7 Shutting Down the TPS6040x-Q1

If shutdown is necessary, use the circuit in [Figure 32](#). The output resistance of the TPS6040x-Q1 will typically be $15\ \Omega$ plus two times the output resistance of the buffer.

Connecting multiple buffers in parallel can reduce the output resistance of the buffer driving the IN pin.

Copyright © 2016, Texas Instruments Incorporated

Figure 32. Shutdown Control

9.3.8 GaAs Supply

A solution for a $-2.7\text{-V}/3\text{-mA}$ GaAs bias supply is proposed in Figure 33. The input voltage of 3.3 V is first inverted with a TPS60403-Q1 and stabilized using a TLV431 low-voltage shunt regulator. Resistor R_P with capacitor C_P is used for filtering the output voltage.

Copyright © 2016, Texas Instruments Incorporated

Figure 33. GaAs Supply

A $0.1\text{-}\mu\text{F}$ capacitor was selected for $C_{(fly)}$. By this, the output resistance of the inverter is about $52\ \Omega$.

$R_{P_{MAX}}$ can be calculated using Equation 14.

$$V_O = -\left(1 + \frac{R_1}{R_2}\right) \times V_{ref} - R_1 \times I_{I(ref)} \quad (14)$$

A $100\text{-}\Omega$ resistor was selected for R_P .

The reference voltage across R_2 is $1.24\ \text{V}$ typical. With $5\text{-}\mu\text{A}$ current for the voltage divider, R_2 gets Equation 16 to Equation 17.

(15)

$$R_{P_{MAX}} = \left(\frac{V_{CO} - V_O}{I_O} - R_O \right) \quad (16)$$

With: $V_{CO} = -3.3\ \text{V}$; $V_O = -2.7\ \text{V}$; $I_O = -3\ \text{mA}$

$$R_{P_{MAX}} = 200\ \Omega - 52\ \Omega = 148\ \Omega$$

With $C_P = 1\ \mu\text{F}$ the ratio V_O/V_I of the RC post filter is Equation 18.

$$R2 = \frac{1.24 \text{ V}}{5 \mu\text{A}} \approx 250 \text{ k}\Omega$$

$$R1 = \frac{2.7 - 1.24 \text{ V}}{5 \mu\text{A}} \approx 300 \text{ k}\Omega$$

(17)

$$\left| \frac{V_O}{V_I} \right| = \frac{1}{\sqrt{1 + (2\pi \cdot 125000 \text{ Hz} \times 100 \Omega \times 1 \mu\text{F})^2}} \approx 0.01$$

(18)

9.3.9 Step-Down Charge Pump

The application generates an output voltage of 1/2 of the input voltage.

By exchanging GND with OUT (connecting the GND pin with OUT and the OUT pin with GND), a step-down charge pump can easily be formed. In the first cycle S1 and S3 are closed, and $C_{(fly)}$ with C_O in series are charged. Assuming the same capacitance, the voltage across $C_{(fly)}$ and C_O is split equally between the capacitors. In the second cycle, S2 and S4 close and both capacitors with $V_I/2$ across are connected in parallel.

Figure 34. Step-Down Principle

Copyright © 2016, Texas Instruments Incorporated

Figure 35. Step-Down Charge Pump Connection

The maximum input voltage between V_I and GND in the schematic (or between IN and OUT at the device itself) must not exceed 5.5 V. For input voltages in the range of 5.5 V to 11 V, an additional Zener-diode is recommended (see [Figure 36](#)).

Figure 36. Step-Down Charge Pump Connection With Additional Zener Diode

10 Power Supply Recommendations

The TPS6040x-Q1 device family has no special requirements for its power supply. The power supply output needs to be rated according to the supply voltage, output voltage and output current of the TPS6040x-Q1.

11 Layout

11.1 Layout Guidelines

Figure 37 shows a PCB layout proposal for a single-layer board. Take care to connect all capacitors as close as possible to the device to achieve optimized output voltage ripple performance.

11.2 Layout Example

Figure 37. Recommended PCB Layout for TPS6040x-Q1 (Top Layer)

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
